

Software Tools and Technologies Lab II Assignment 2

1. What is the difference between the following repositories? Try to recreate both. Now comment on the evolution of the second repository.

Ans:

In the first repository, when second commit is implemented, there are two files present in the tree of the commit and in the second repository, there is only one file in the tree of the commit and the first file is deleted.

In the second repository, the first file after the first commit is deleted from the git repository using the command 'git rm file1'. And then another file is made with the same content as the file1. Then it is added and committed in the git repository.
